## **TUTORIAL ORGANIC CHEMISTRY**

- 1. Draw the possible stereoisomers of tartaric acid (2,3-dihydroxy butan-1,4 dioic acid).
- 2. Draw a skeletal structure corresponding to each name below:
  - a. (Z)-3-ethoxybut-2-en-1-ol
  - b. (E)-1-bromo-4-ethylhept-3-ene
- 3. Explain why:
  - a. 4-nitrophenol is a stronger acid than phenol
  - b. Cyclopentadiene is unusually acidic (pKa 16)
- 4. Which substance in each of the following pairs is more reactive as a nucleophile? Explain
  - a. i) (CH<sub>3</sub>)<sub>2</sub>N or (CH<sub>3</sub>)<sub>2</sub>NH (ii) (CH<sub>3</sub>)<sub>3</sub>B or (CH<sub>3</sub>)<sub>3</sub>N (iii) H<sub>2</sub>O or H<sub>2</sub>S
- 5. Predict the mechanism by which reaction might happen.

$$(CH_3)_2CH$$
-Br  $\frac{NaCN \text{ in ethanol}}{25^{\circ} \text{ C}}$ 

$$(CH_3)_2CHCH_2CH_2-OH \frac{HBr 48\% in H_2O}{50^{\circ} C}$$

- 6. 3-Bromo-1-butene and 1-bromo-2-butene undergo  $SN_1$  reaction at nearly the same rate even though one is a secondary halide and the other is primary. Explain.
- 7. When 1-iodo-1-methylcyclohexane is treated with NaOCH<sub>2</sub>CH<sub>3</sub> as the base, the more highly substituted alkene product predominates. When KOC(CH<sub>3</sub>)<sub>3</sub> is used as the base, the less highly substituted alkene predominates. Give the structures of the two products and offer an explanation
- 8. Of the following compounds, which will react rapidly with bromine (Br<sub>2</sub>) at room temperature in the dark?

Benzene, cyclohexene, cyclohexane, propanoic acid, phenol, nitrobenzene, hexyne, 2,2-dicholoropropane.

9. Which compounds undergo electrophilic nitration more rapidly than benzene? Which compounds give meta substitution under electrophilic bromination conditions?

A B C D E F G

$$CH_3 \longrightarrow N(CH_3)_2 \longrightarrow SO_3H \longrightarrow NO_2 \longrightarrow CH_3 \longrightarrow F G$$

$$CH_3 \longrightarrow CH_3 \longrightarrow CH_3 \longrightarrow CH_2 \longrightarrow C$$

## 10. Explain

- a. At what position in the ring bromination of phenyl benzoate is expected to occur
- b. Major products of nitration of acetophenone.

## Answer key

- 5. (1) SN2, iodide anion is an excellent nucleophile and a very weak base.
  - (2) SN2, elimination is not possible, benzyl halides are very reactive.
  - (3) E2, methoxide anion is a strong base.
  - (4) SN1, this is a tertiary halide, and water is a good ionizing solvent.
  - (5) SN2, cyanide anion is a good nucleophile and a weak base.
  - (6) No Reaction, elimination is not possible and substitution is severely hindered.
  - (7) SN2, this is a primary halide. (some rearrangement may occur)

## 6. (1) A,B,E,G,I,L (2) C,D,F,H,J

Note that bromobenzene (K) is less reactive than benzene, but normally gives ortho/para substitution.
